

Troubleshooting Pika Wi-Fi Signal Not Found

If your computer or phone cannot detect Pika's Wi-Fi signal at all, preventing the scanner from connecting, please follow the steps below to troubleshoot the issue.

Note: This guide applies when Pika's Wi-Fi signal cannot be found at all. If the Wi-Fi network is visible but the connection fails, try turning on Airplane Mode and then reconnecting.

Check the Pika Firmware Version

First, check the current firmware version of your Pika. Swipe down on the screen to open the Settings page, then tap "About" to see the firmware info.

If the Firmware Version Is V1.1.6

You can connect Pika to a computer or Android phone via a USB cable and upgrade the scanner firmware to V1.1.8 or later to resolve the issue.

Method 1: Update the Firmware Using a Computer

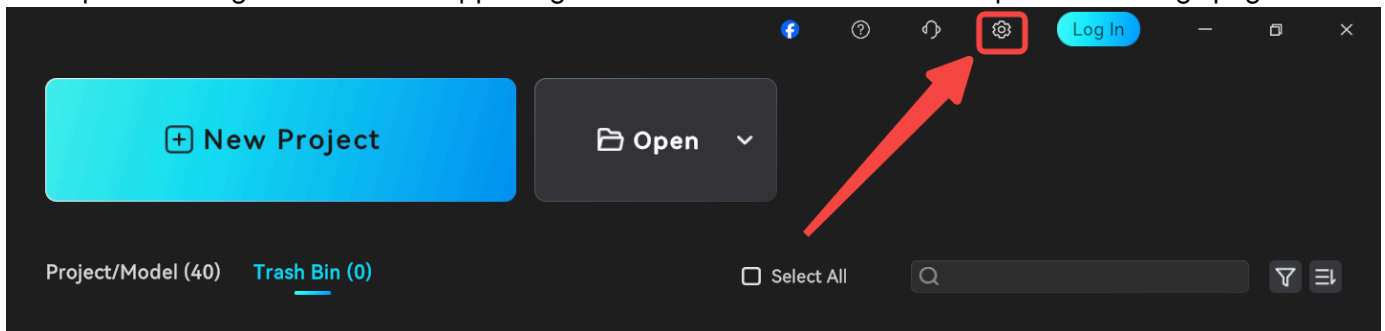

1. Switch the mode switch on the side of the Pika to the corresponding wired USB position.

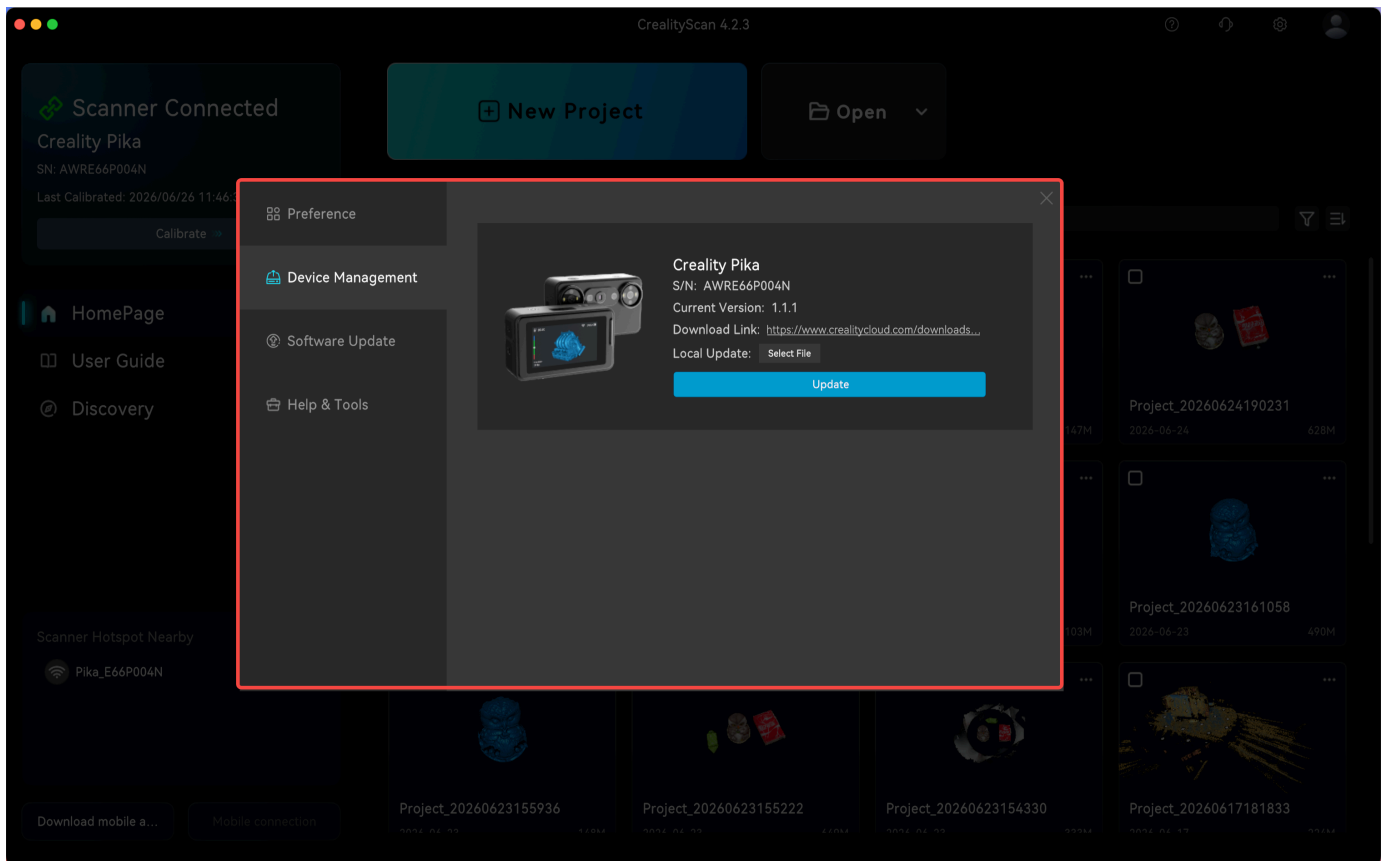

2. Connect Pika to your computer using a USB cable.

3. Tap the Settings button in the upper-right corner of the home screen to open the Settings page.

4. Open Device Management and perform the firmware update. Please update the firmware to V1.1.8 or later.

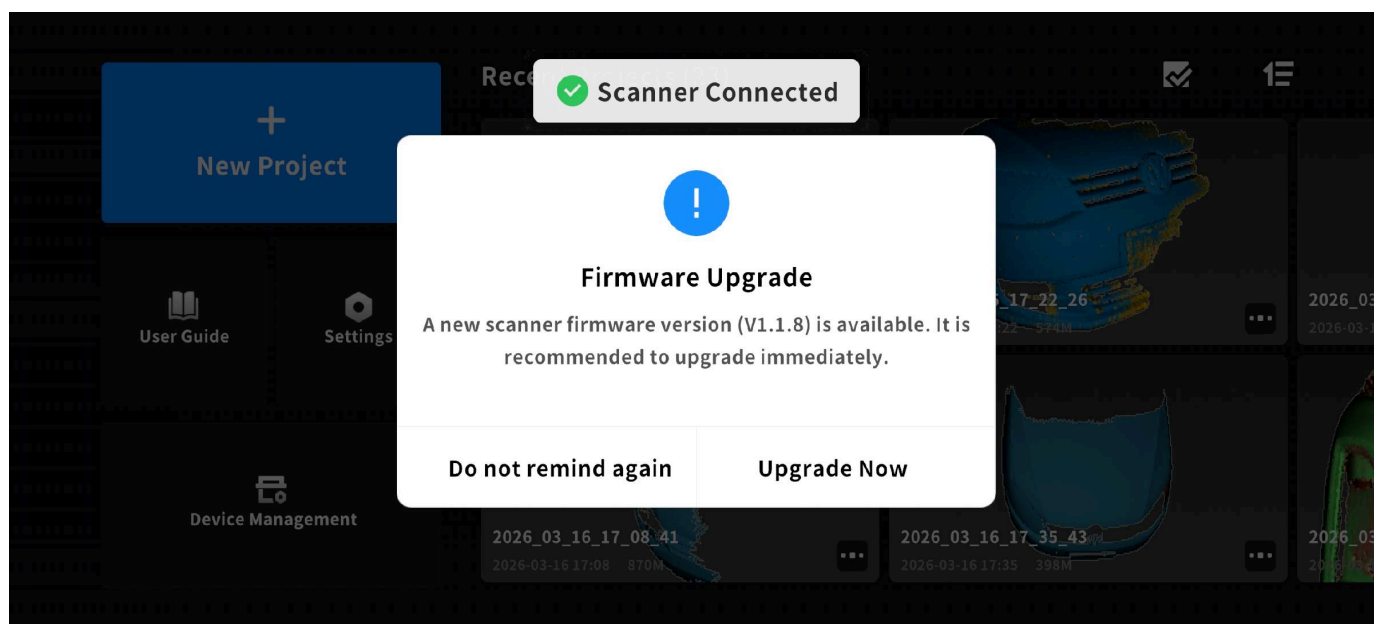

Method 2: Update the Firmware Using an Android Phone

1. Switch the mode switch on the side of the Pika to the corresponding wired USB position.

2. Connect Pika to an Android phone using a USB cable, then update the scanner firmware to V1.1.8.

► **Note:** iOS devices currently do not support updating Pika's firmware via USB.

If the Firmware Version Is Later Than V1.1.6

If your Pika's firmware version is later than V1.1.6, but your computer or phone still cannot detect Pika's Wi-Fi signal, check whether the device supports Wi-Fi 6.

- ▶ If your computer or phone does not support Wi-Fi 6, it may not be able to detect Pika's Wi-Fi signal. We recommend using a device that supports Wi-Fi 6 to connect to Pika.
- ▶ If the issue persists, please contact our Customer Support team at cs@creality.com.
